# Kodak Oracle Microfilm Software

The Oracle decoding software is designed to import scanned tiff images taken from a Kodak Oracle film and process these depending on the barcodes attached to each image.
The process is simple

- Import the scanned images of an Oracle film

- Create a folder that represents the film number

- Process the images to create a folder structure based on barcode values

- Allow manual correction of any miss-reads.

- Process these images to create a folder and file structure that mirrors the original film

- Create a CSV file that contains barcode values and image paths. This can then be used with a document management system.

The software is designed to read positive and negative films. You can use the software to load an image and read the barcode value. It will output the images as Type 4 compression Tiff.
The software is compatible with Windows XP and 7.
